PubliBike is reducing its CO² emissions

Fully electric and freshly branded: the PubliBike logistics team is now on the road with four electric commercial vehicles in the Bern network.

PubliBike Bern received the four VW e-Crafters a few weeks ago from its partner AMAG. The fully electric commercial vehicles will replace the previous diesel-powered commercial vehicles and will be used for balancing logistics between stations.

We use three-wheeled electric vehicles from the manufacturer Kyburz for our battery logistics (replacing e-bike batteries). PubliBike is now only using one non-electric commercial vehicle in the Bern network. Thanks to its special design, this vehicle has a high transport capacity and is mainly used in the peak season.

By switching over to the four VW e-Crafter transporters, PubliBike is fulfilling an important sustainability criterion for the city of Bern and its other partner communities. It is also a further step towards implementing our own environmental responsibility strategy and zero emissions vision.

PubliBike strives to offer a low-impact and environmentally friendly mobility solution through its services. The company aims to contribute to the mobility transition and implements measures to protect the environment and promote sustainable development.

Please do not hesitate to contact us if you have any questions.
